Power Up of Southern Wisconsin  
Mr. Mike Williamson  
310 E. Leana St.  
Lena, IL 61048

Dear Mike,

Just wanted to let you know about the excellent results our race team is getting with Power Up in our Harley Davidson drag racing motorcycle. Since we use nitro-methane for fuel, we really put Power Up to the test each and every time we take to the strip. Our engine generates 300 H.P. from 102 cubic inches. From the time we start the engine and make an eight second run down the quarter mile track, the motor will use one gallon of fuel and reaches speeds around 160 MPH. Our engine doesn't have an oil pump or an oil reservoir. We put eight ounces of oil and one-third ounce of Power Up in our engine.

The difference Power Up makes is almost unbelievable! We first used Power Up last March in Daytona. We finished fourth, which was our best finish in three years of professional racing! We were doubly excited when we got back to Wisconsin. We disassembled the engine, expecting the usual melted pistons, wore out valves and bearings. To our surprise, for the first time in three years of racing, the engine looked excellent. Normally we have to tear down engines after every race, but with Power Up we run many times without a tear down. We can only attribute the excellent condition of the engine to your product, since we made no other changes.

Last year we finished in the top ten in the nation. This year we'll finish second or third, with the help of Power Up. This last weekend we broke the national speed record of one-eighth mile at 143 MPH! Next year we look forward to even better results.

I'm still attempting to schedule a meeting of all five of our dealership managers and our lease truck division manager. I would like them to see your demonstration, which really convinced me. I'd also like them to see the success your product has demonstrated in so many other fleet vehicles. Thank you again, Mike, for introducing us to Power Up.

Best Regards,

Service Manager
